As a college professor teaching computer courses to teachers in Connecticut, I know that infusing digital learning is critical to promoting literacy skills, especially in the era of common core standards. I teach a course on site in a school in Connecticut, and we do not have sufficient broadband access in this school for showing the teachers in the course the wealth of resources available to them to enhance students literacy skills. Access to high-speed broadband is the key to teaching the course and leading the teachers to teach effectively with online tools in their own schools.
